Car-Go System

A Car Rental Management System for clients and owners in our community specially on Maramag

Rationale

Car rental services are highly useful if you are traveling for various reasons, with your family, or simply on vacation. Car rental is an important part of many people's vacation plans and is used all over the world to get around.

I need to develop a vehicle rental management system for a car rental owner. As the system's primary component, customers will be able to search for preferred motors and reserve them for an apartment. The device's second function will allow the employer to easily update records on new cars, fee information, and other data.

General and specific objectives

General objective: The Car-Go System is a web-based application for online vehicle rental reservations from a car rental business and provides an easy-to-use internet platform for automobile rental clients to search for and reserve vehicles.

Specific objectives: it will enable the employer to simply update records on new automobiles, fee information, and other data.

Features

- User and owner can sign up and log in.
- Facilitate automated check-in and checkout.
- Driving license, documents verifier and scanner
- Trace pending payments and Location-based rentals
